WHAT WE DO

RITEIA Association (Research international Tertiary Education Impact in Africa) provide a forum for education researchers to debate internationally tertiary education impact in Africa relevant issues across all levels of education, including:

- alternative education,
- adult education,
- vocational education and training, and
- higher education.
- The need of the right courses
- Collaboration with immigration and education ministry in different sectors.
- The impact of international tertiary education in Africa.
- The future of business aspect of tertiary education in Africa and to international African students

The association includes contributions to and from international tertiary education providers and international researchers, representing a variety of relevant disciplinary perspectives.
Contents include original research articles employing quantitative, qualitative or mixed-methods, methodological and theoretical discussion papers, and education policy analyses.

Tertiary education refers to all formal post-secondary education, including public and private universities, colleges, technical training institutes, and vocational schools. Tertiary education is instrumental in fostering growth, reducing poverty, and boosting shared prosperity. A highly skilled workforce, with lifelong access to a solid post-secondary education, is a prerequisite for innovation and growth: well-educated people are more employable and productive, earn higher wages, and cope with economic shocks better.

Tertiary education benefits not just the individual, but society as a whole. Graduates of tertiary education are more environmentally conscious, have healthier habits, and have a higher level of civic participation. Also, increased tax revenues from higher earnings, healthier children, and reduced family size all build stronger nations. In short, tertiary education institutions prepare individuals not only by providing them with adequate and relevant job skills, but also by preparing them to be active members of their communities and societies.

The economic returns for tertiary education graduates are the highest in the entire educational system – an estimated 17% increase in earnings as compared with 10% for primary and 7% for secondary education. These high returns are even greater in Sub-Saharan Africa, at an estimated 21% increase in earnings for tertiary education graduates.

As the youth population continues to swell and graduation rates through elementary and secondary education increase dramatically, especially in regions like South Asia, Sub-Saharan Africa, Latin America, and the Middle East and North Africa, there is an intensifying demand for expanded access to tertiary education of good quality. Diversification of institution types and delivery modalities will become increasingly more central to meeting this expanded demand. Tertiary technical and vocational education and training, as one example, can provide an effective and efficient complement to traditional university studies in providing students with skills and knowledge relevant to the labor market.

Governments are increasingly recognizing that the entire educational system – from early childhood through tertiary education – must reflect and be responsive to rapidly evolving social and economic demands and needs within an expanding globalized knowledge economy, which increasingly demands a better-trained, more skilled, and adaptable workforce.

There are around 222 million students enrolled in tertiary education globally, up from 100 million in 2000. In Latin America and the Caribbean, the number of students in tertiary education programs has increased since the early 2000's, but quality concerns remain. In Sub-Saharan Africa, enrollments have doubled every twenty years since the late 1970s. This massive growth remains critical as a student with a tertiary education degree in the region will earn more than twice as much as a student with just a high school diploma over a lifetime, though, of course, a variety of factors such as social capital and networks, institution quality, and academic program selection are among the factors that lead to notable heterogeneity of outcomes at for individual students in every country.
